A SECOND RECORD FOR THE GIANT CHICKWEED, *MYOSOTODON AQUATICUM*, IN NEW HAMPSHIRE: In a moist meadow-pasture along the Connecticut River, one mile south of Monroe, northern Grafton Co., New Hampshire, I found on August 29, 1970 a large number of plants of the giant chickweed, *Myosotodon aquaticum* (L.) Moench. The plant reminded me strongly of *Stellaria pubera*, but I noticed the 5 styles. The only other record for New Hampshire is at Bristol, in extreme southeastern Grafton Co.; however, the plant has been found along the Connecticut River at Bradford, Vermont.

I suspect that the plant occurs in grassy meadows all along the Connecticut River. It is true, however, that forests, rocky banks, and towns come right down to the river at many places. Specimens are being sent to the herbaria of New England Botanical Club, University of New Hampshire, and the Pringle Herbarium, University of Vermont.
